

U.S.SAWS™

DUCTILE IRON BEVELING

The U.S.SAWS Ductile Iron Beveler is designed to let you bevel while you cut, followed by grinding for a smooth finish. This innovative process eliminates the need to use the side of an abrasive cut-off blade, making pipe beveling safer and more efficient.

Built for convenience, this beveler allows for a one-man operation, making it easy to bevel pipes both in and out of the trench. It attaches and detaches quickly from the saw, streamlining workflow and improving job site efficiency. Additionally, it is a cost-effective alternative to traditional cut-off blades, reducing overall tool wear and expenses.

This two-step process begins by cutting around the pipe, leaving 1 inch uncut to maintain stability. In the second step, lower the blade into the cut until the beveler makes contact with the pipe, ensuring a precise and controlled beveling process.

Features:

- Bevel while you cut - then follow with grinding for finishing
- Eliminates practice of using side of abrasive cut off blade
- Cost effective when compared to cut-off blades
- Bevel pipe in or out of trench
- Is easily attached to and removed from saw
- Adapters are available for nearly every saw on the market

SAW MAKE	PART NUMBER	ARBOR SIZE
Husqvarna	US24746	1"
Stihl	US24747	20 mm
